

Group - 4 loop Westinghouse Ice Condense Facilitator: Steve Lisi Successes - What went right

McGuire (Steve Lisi)

- First success – Replacement on the Rx Head Insulation U-1 estimated 6.947 Rem including Head inspection. Actual received 4.421 Rem – 66% of the estimate
 - Second success –
-

Catawba (John Cooper)

- First success – Dry Cask Campaign went from around 1.5 rem, per cask to 90 mrem per cask.
 - Second success – Because CNS still has a D-5 S/G, Eddy current testing was required every outage, got the tech spec has been changed to every other outage...big savings
-

Group - 4 loop Westinghouse Ice Condense Facilitator: Steve Lisi Successes - What went right

Sequoyah (Jim Fuller)

- First success – Transfer canal system upgrade, once upgraded no entry ever again into canal. 2.2 rem estimated for measurements, used laser scanning did it for 56 mrem.
- Second success – Planned mid cycle outage, doing acid reduction, no CCB, 55Ci of cobalt removed.

DC Cook (Dave Miller)

- First success – Baffle bolt replacement, 6 person rem, goal was 12 person rem
 - Second success – Use of CZT for shipping and shielding verification.
-

Group - 4 loop Westinghouse Ice Condenser Facilitator: Steve Lisi
Challenges – What has gone wrong

**McGuire
(Steve Lisi)**

- First challenge: Departmental dose ownership, lack of dose reduction initiatives from site departments. Relying solely on ALARA department to come up with initiatives.
- Second challenge: Due to thermal stratification weld issues during our M2R24, 13 rem of additional work planned for M1R25 in fall. Higher CRE

**(Catawba)
(John Cooper)**

- First challenge: Staffing Resources with loss of Decon team
 - Second challenge: Loss of the Pace program for modeling systems for job planning
-

Group - 4 loop Westinghouse Ice Condenser Facilitator: Steve Lisi
Challenges – What has gone wrong

(Sequoyah)
(Jim Fuller)

- First challenge: Rx Cavity, high dose, high contamination mostly CO-60, caused by the specimen capsules
- Second challenge: Lower internal lift, Prior planning, fleet having issues

(DC Cook)
(David Miller)

- First challenge: Cooling Head blew air into contaminated area.
 - Second challenge: Keeping technicians challenged to use new technology
-

Group - 4 loop Westinghouse Ice Condenser Facilitator: Steve Lisi
Challenges – What has gone wrong

- **McGuire**-Using RDS-31 and AWM to preclude RP monitoring lines during resin evolution
- **Catawba** –
- **Sequoyah** – ALARA Workshops to close gaps between outage estimate and goal
- **D.C. Cook** – Dry Ice Westinghouse decon of baffle bolts
